Jadavpur University, India

### 1 Sets and Set Theory : Some Definitions

✓ **Definition 1.1** A set is a collection of distinct objects.

**Object :** An object occurs only once in a set

✓ **Definition 1.2** A **multi-set** is a collection of objects in which an object may occur several times.

✓ **Multiplicity :** The number of times an object occurs is the *Multiplicity* of the Sets

✓ **Definition 1.3** A **binary relation** from a set  $S$  to a set  $T$  is a subset of the Cartesian product of  $(S \times T)$

✓ **Relation :** A relation on  $S$  is a subset of  $(S \times S)$

✓ **Multi-relation :** A **multi-relation** on  $S$  is a **multi-subset** of  $(S \times S)$

**Example :**

Set  $S = \{1, 3, 5, 7\}$

Multi-Set  $M = \{1, 1, 1, 2, 2, 3\}$

Relation  $\mathfrak{R} = \{(1, 3), (3, 5), (3, 7)\}$

Multi-Relation  $T = \{(1, 3), (1, 3), (1, 1), (3, 3), (5, 7)\}$

#### 1.1 Definition of Graph

✓ **Definition 1.4** A graph  $G$  is a finite non-empty set  $V$  together with a symmetric irreflexive binary relation  $A$  on  $V$

- Definition 1.4 is an *algebraic set theoretic* definition of a graph

- The elements of the set  $V$  are called the vertices of the graph

- ✓ The relation  $\mathfrak{R}$  is called the adjacency relation and if  $u$  is related to  $v$  by  $\mathfrak{R}$ , we say that  $u$  is adjacent to  $v$  and write  $u\mathfrak{R}v$

Since  $\mathfrak{R}$  is a *Symmetric Relation*, it defines a set  $E$  of  $V_{(2)}$ , the set of **two**-subsets of  $V$ , namely

$$E = \{\{u, v\} | u, v \in V; u\mathfrak{R}v\}$$

The elements of the set  $E$  are called the edges of the graph, where the elements are referred to as  $e_{uv} \in E(G)$ , where  $u, v \in V(G)$ .

Sometimes, the elements of  $E(G)$  is also represented as  $e_1, e_2, \dots, e_n$ , where  $n = |E(G)|$ .

**Definition 1.5** A graph  $G$  is a pair  $(V, E)$ , where  $V(G)$  is a non-empty set whose elements are called of  $G$  and  $E(G)$  is a subset of  $V_{(2)}$ , whose elements are called the edges of  $G$ .

**Note :** There is an *incidence relation*  $I$  between the vertex set  $V$  and the edge set  $E(G)$  of a graph.

If  $e \in E(G)$ , then there is a pair of *distinct vertices*  $u$  and  $v$  such that  $e = \{u, v\}$ .

$\Rightarrow$   $u$  and  $v$  are the end-vertices of ends of  $e$  and say that  $u$  and  $v$  are incident on  $e$  with  $e(uIe$  and  $vIe)$ .

$\Rightarrow$  We can also say  $e$  is incident with  $u$  and  $v$  :  $eI'u$  and  $eI'v$ , where  $I'$  is a relation converse of  $I$ .

**Definition 1.6** A graph  $G$  is a pair of disjoint set of  $V(G)$  (non-empty) and  $E(G)$  and a 1-1 incidence function  $f : E(G) \rightarrow V_{(2)}$

If  $f(e) = \{u, v\}$ ,  $e$  is said to be incident on  $u$  and  $v$ ;  $u$  and  $v$  is said to be incident with  $e$

**Note :** All the 3 definitions are equivalent : Definition 1.4, 1.5, 1.6

• **Vertices** are sometimes referred to as *nodes/points*.

• **Edges** are sometimes referred to as *lines*

$|V(G)|$  : Order of the Graph is the **cardinality** of the number of vertices

$|E(G)|$  : Size of the Graph is the **cardinality** of the number of edges

• Since the vertex set of every graph is non-empty, the order of every graph is *at least* 1.

• A graph with exactly one vertex is called a trivial graph and all other graphs non-trivial.

• The *order* of a non-trivial graph is *at least* 1.

**Example 1.1** Consider the set  $S = \{2, 3, 5, 8, 13, 21\}$

Let  $\mathfrak{R}$  be the relation of pairs of distinct integers belonging to  $S$  whose sum/difference  $\in S$ , e.g.  $\{2, 3\}, \{2, 5\}, \dots$

$\therefore, H = (V, E)$ , where  $V(H) = S$  and

$$E(H) = \{\{2, 3\}, \{2, 5\}, \{3, 5\}, \{3, 8\}, \{5, 8\}, \{5, 13\}, \{8, 13\}, \{8, 21\}, \{13, 21\}\}$$

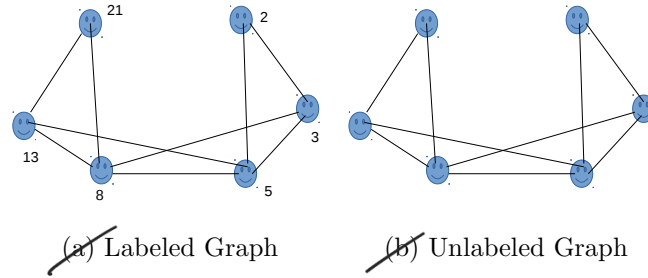

Figure 1: Graph Types

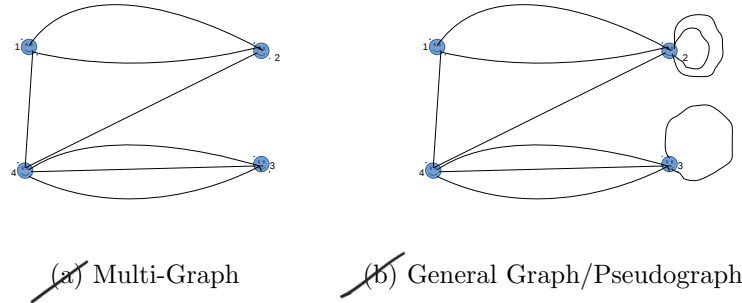

Figure 2: Graph Types

## 2 Other Definitions of Graphs

**Definition 2.1 (Simple Graph)** A Simple Graph is a graph if each pair of vertices,  $\{u, v\}$  is joined by at most one edge.

**Parallel Edges :** Multiple edges/lines joining a pair of vertices.

**Loops :** In some cases, we have to allow one or more lines joining a point to itself

**Loops** with multiplicity greater than 1 are **multiple loops**

**Definition 2.2 (Multigraph)** A Multigraph is a pair  $G(V, E)$ , where  $V(G)$  is a non-empty set of vertices and  $E(G)$  is a multi-set of edges, being a multi-subset of  $V_2$ .

The number of times an edge  $e = uv$  occurs is called **multiplicity of  $e$**

**Underlying Graph :** The graph obtained by replacing all multiple edges by a single edge is called the **Underlying graph** of  $G$ .

**Definition 2.3 (General Graph/Pseudograph)** A General Graph/Pseudograph is a pair  $G(V, E)$ , where  $V(G)$  is a non-empty set of vertices and  $E(G)$  is a multiset of edges, being a multi-subset of  $V_2$ , the set of unordered pairs of elements of  $V(G)$ , not necessarily distinct.

## 3 Complete Graph

A graph  $G(V, E)$  for which there exists all incidence relations between all vertices,  $V(G)$  is known as the **complete graph**,  $K_{|V(G)|}$  or  $K_n$ , where  $n = |V(G)|$ . The order of a complete graph is  $|V(G)|$ .

In Figure 3, the order of the graph is 5.

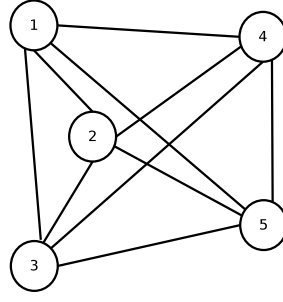

Figure 3: Complete Graph :  $K_5$

## 4 Directed Graphs / Digraphs

**Directed Graphs/Digraphs** are used for modelling of systems, where is a natural sense of orientation.

**Definition 4.1 (Digraph)** A Digraph is defined as  $D(V, E)$ , where  $V(D)$  is a non-empty set whose elements are called the vertices and  $E(D)$  is a subset of  $V^{(2)}$  (i.e. the set of ordered pairs of distinct elements of  $V(D)$ ), whose elements are called the arcs of  $D$ .

OR

A Digraph  $D(V, E)$  is a quadruple consisting of a vertex set  $V(D)$ , an edge set  $E(D)$ , a function indicating each edge as an ordered pair of vertices and another function assigning the weights to each ordered pair, where in the ordered pair :

- ✎ the first vertex of the ordered pair is the tail of the edge and the second is the head, together they being the endpoints.
- ✎ we say that an edge is from its tail to its head.

**Definition 4.2 (Multi-Digraph)** A multi-digraph  $D(V, E)$  is a pair of  $(V, E)$ , where  $V(D)$  is a non-empty set of vertices and  $E(D)$  is a multiset of arcs, being a multi-subset of  $V^{(2)}$ .

- ✎ The number of times an arc occurs in  $E$  is called its multiplicity and arcs with multiplicity greater than 1 are called multiple arcs of  $D$ .

- An arc  $(u, v) \in E(D)$  can also denoted as  $uv$  or  $\vec{uv}$ , where

✎  $u$  initial vertex/tail/source

✎  $v$  terminal vertex/head/sink

- ✎ A digraph is an irreflexive binary relation on  $V$ .

- ✎ The out-neighbourhood or successor set is defined as

$$N^+(v \in V(D)) = \{x \in V(D) : v \rightarrow x\}$$

- ✎ The in-neighbourhood or predecessor set is defined as

$$N^-(v \in V(D)) = \{x \in V(D) : x \rightarrow v\}$$

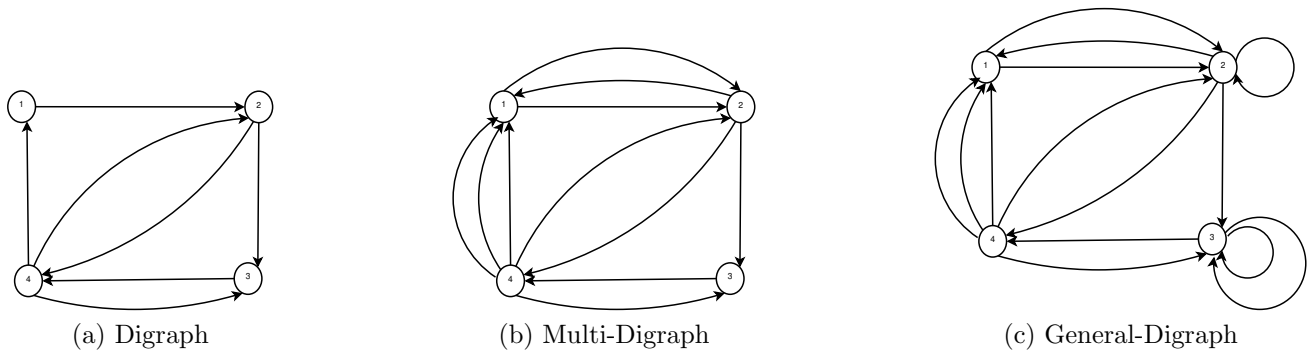

Figure 4: Directed Graphs

### Example : Modelling a Coin Toss

- There are Two States Only Ever: Heads (H) or Tails (T)
- Each coin toss is a finite state or event.
- Coin can either stay in same state (say another Head) or change (to Tail)

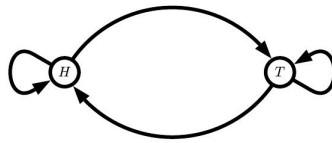

Figure 5: Modelling a Coin Toss

## 5 Orientations and Tournaments

**Definition 5.1 (Orientation of a Graph)** An orientation of a graph  $G(V, E)$  is a digraph  $D(V, E)$  obtained from  $G(V, E)$  by choosing an orientation  $x \Rightarrow y$  or  $y \Rightarrow x$  for every edge  $xy \in E(G)$ .

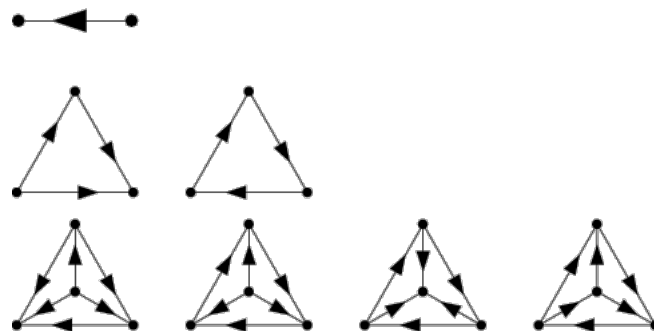

Figure 6: Tournament : The first and second 3-node tournaments shown above are called a transitive triple and cyclic triple, respectively (Harary 1994, p. 204)

**Tournaments / tournament graphs** is an orientation of a complete graph. They are so named because an  $n$ -node tournament graph corresponds to a tournament in which each member of a group of  $n$  players plays all other  $n - 1$  players, and each game results in a win for one player and a loss for the other.

**Example 5.1** A so-called score sequence can be associated with every tournament giving the set of scores that would be obtained by the players in the tournament, with each win counting as one point and each loss counting as no points.

A different scoring system is used to compute a tournament's so-called tournament matrix, with 1 point awarded for a win and -1 points for a loss.

## 6 Subgraphs

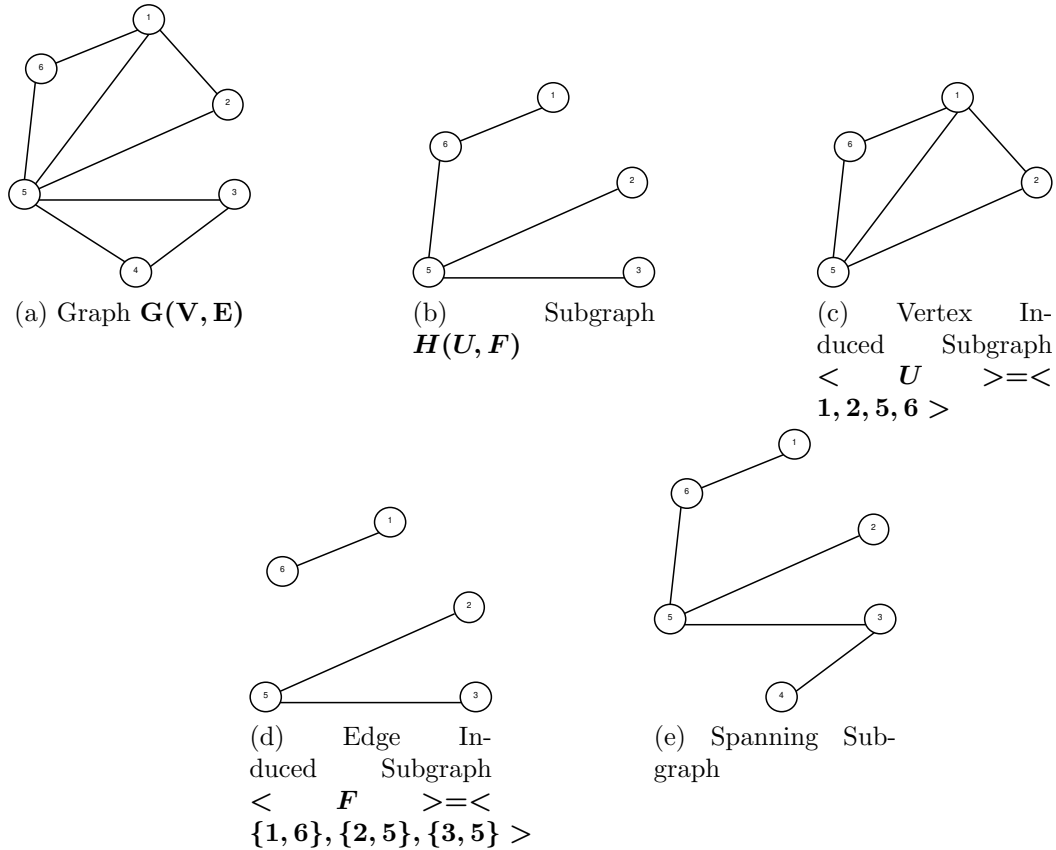

Figure 7: Sub-Graph Types

**Definition 6.1 (Subgraph)** A Subgraph of a graph  $G(V, E)$  is a graph  $H(U, F)$  with  $U(H) \subseteq V(G)$  and  $F(H) \subseteq E(G)$

When  $U(H) = V(G)$ ,  $H$  is a spanning subgraph of  $G$

If  $H$  is a subgraph of  $G \Rightarrow G$  is a super-graph of  $H$

### 6.1 Induced Subgraph

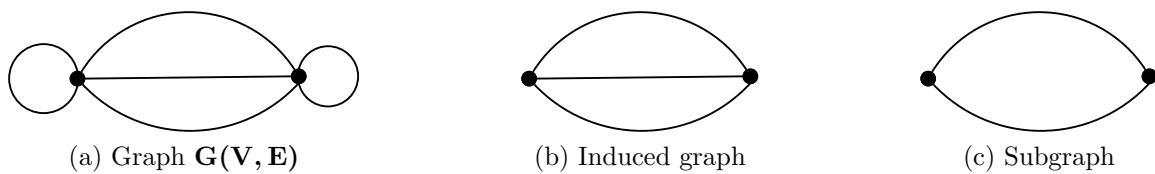

Figure 8: Sub-graph and Induced-graph Types

**Definition 6.2 (Induced Subgraph)** If a subgraph has every possible edge, it is an induced subgraph.

- When  $F(H)$  consists of all the edges of  $G$  joining pairs of vertices of  $U(H)$ , we say  $H$  is vertex induced subgraph of  $G$ .
- Given a subset  $F$  of edges of  $G$ , let  $U(H)$  be the set of end-vertices of the edge of  $F(H)$ , then  $F(H)$  is the edge induced subgraph of  $G$ .

## 7 Partite Graphs

**Definition 7.1 ( $r$ -Partite)** A graph  $G(V, E)$  is said to be  $r$ -Partite ( $r > 0$ ), if its vertex set can be partitioned as  $V = V_1 \cup V_2 \dots \cup V_r$  such that if  $uv \in V(G)$ , then  $u \in V_i$  and  $v \in V_j$ , i.e. everyone of the induced sub-graph  $\langle V_i \rangle$  is an empty graph.

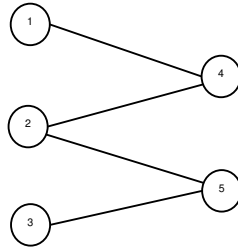

Figure 9: Bipartite Graph :  $\langle V_1 \rangle = \langle 1, 2, 3 \rangle$ ,  
 $\langle V_2 \rangle = \langle 4, 5 \rangle$ ,  $E(V_1) = E(V_2) = \phi$

If an  $r$ -partite graph has all possible edges, i.e.  $uv \in E$  for all pairs  $u \in V_i, v \in V_j$ , then it is called a complete  $r$ -partite graph. If  $|V_i| = n_i$ , then the partite graph is denoted as  $K_{n_1, n_2, \dots, n_k}$ .

A 2-partite/bipartite graph is defined as a graph  $G(V, E)$ , where  $V = V_1 \cup V_2$  is the bipartition of the vertices  $V$ . If there exists all possible edges between  $V_1$  and  $V_2$ , then it is referred to as a complete bipartite graph, denoted as  $K_{|V_1|, |V_2|}$ .

The complete bipartite graph  $K_{1, n}$  is called an  $n$ -star or an  $n$ -claw graph.

## 8 Operations on Graphs

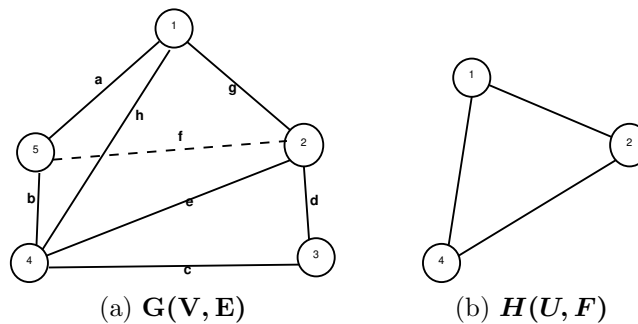

Figure 10: Main Operational Graphs

## 8.1 Complement of a Graph

**Definition 8.1 (Complement of a Graph)** The complement  $\overline{G} = (V, \overline{E})$  of a graph  $G(V, E)$  has the same vertex set as  $G$  and its edge set is the set complement  $\overline{E}(G)$  of  $E(G)$  in  $V(2)$ , i.e.  $uv$  is an edge of  $\overline{G}$  iff  $uv$  is not an edge of  $G$ . A graph  $G$  is said to be self-complementary if  $G = \overline{G}$ .

The complement of  $\overline{K_n}$  of the complete graph of order  $n$  is clearly the empty graph of order  $n$ .

## 8.2 Removal of Edge

**Definition 8.2** Let  $G(V, E)$  be a graph and  $F \subset E(G)$ . Then the graph  $H = (V, E - F)$  with the same vertex set as  $G$  and edge set  $E - F$  is said to be obtained from  $G$  by removing the edges in the set  $F$ . It is denoted by  $G - F$ . If  $F$  consists of a single edge  $e \in G$ , the graph obtained by removing  $e$  is denoted by  $G - e$ .

**Definition 8.3 (Isolated Vertex)** A vertex  $v$  of a graph  $G$  which is not adjacent with any other vertex is called an Isolated vertex of  $G$ .

For  $F \subseteq E$  or  $e \in E$ ,  $G - F$  or  $G - e$  may contain isolated vertices which are not isolated vertices of  $G$ . The graphs obtained by removing these newly created isolated vertices from  $G - F$  or  $G - e$  are denoted by  $G \setminus F$  or  $G \setminus e$ .

## 8.3 Removal of Vertex

**Definition 8.4** Let  $G(V, E)$  be a graph and  $v \in V(G)$ . Let  $E_v(G)$  be the set of all edges incident with  $v$ . Then the graph  $H = (V - \{v\}, E - E_v)$  is said to be obtained from  $G$  by the removal of the vertex  $v$  and is denoted by  $G - v$ . If  $U \subseteq V$ , the graph obtained by removing the vertices of  $G$  in  $U$ , in any order is denoted by  $G - U$ .

If  $H$  is a subgraph of  $G$ , we denote  $G - V(H)$  by  $G - H$  and  $G - E(H)$  by  $\overline{H}(G)$ . The latter is called the relative complement of  $H$  in  $G$ .

## 8.4 Addition of Edge

**Definition 8.5** Let  $G(V, E)$  be a graph and  $f$  an edge of  $\overline{G}$ . Then the graph  $H = (V, E \cup \{f\})$  is said to be obtained from  $G$  by the addition of the edge  $f$  and is denoted by  $G + f$ . If  $F$  is a subset of edges of  $G$ , the graph obtained from  $G$  by adding the edges of  $F$  in any order is denoted by  $G + F$ .

When the particular edge  $f \in G$  is not specified, one may still use the notation  $G + f$  if all graphs obtained from  $G$  by the addition of any edge  $f$  of  $\overline{G}$  are isomorphic.

## 8.5 Addition of a Vertex

**Definition 8.6** Let  $G(V, E)$  be a graph and  $v \notin V$ . Then the graph  $H$  with vertex set  $V \cup \{v\}$  and edge set  $E \cup \{uv | u \in V\}$  is said to be obtained from  $G$  by adding a vertex  $v$ , and is denoted by  $G + v$ .

Thus  $G + v$  is obtained from  $G$  by adding a new vertex and joining it all vertices of  $G$ .

## 8.6 Contraction of Graph

**Definition 8.7 (Contraction of Graph)** Let  $G(V, E)$  be a graph and  $G$  contract  $e$  is the graph  $G/e$  obtained by deleting  $e$  from  $E(G)$ , deleting  $v, w$  from  $V(G)$  and then adding a new vertex  $z$  which is incident to all edges in  $E(G)$  which were incident to  $v$  or  $w$ .

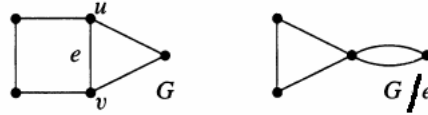

Figure 11: Contraction of a Graph

Note :

1. If  $e \in E(G)$  is a loop then  $E(G) - e = E(G)/e$ .
2. A contraction of  $G(V, E)$  is any graph which can be obtained by recursively contracting edges in  $G(V, E)$ .
3. A minor of a graph,  $G(V, E)$  is any graph which can be obtained by recursively deleting or contracting edges and deleting isolated vertices from  $G(V, E)$ .

## 8.7 Joining/Union of Graphs

**Definition 8.8 (Union of Graphs)** Let  $G(V, E)$  and  $H = (U, F)$  be two graphs with disjoint vertex sets i.e.  $V \cap U = \emptyset$ . Then the join of  $G$  and  $H$  denoted by  $G \vee H$  has vertex set  $V \cup U$  and edge set  $E \cup F \cup [V, U]$ , where  $[V, U] = \{uv | u \in U, v \in V\}$  are all the set of edges joining every vertex of  $V$  to every vertex of  $U$ .

From the above definition,  $G + v = G \vee K_1 = G \vee \overline{K_1}$ .

## 8.8 Intersection of Graphs

**Definition 8.9** The intersection of  $H_1(V_1, E_1)$  and  $H_2(V_2, E_2)$  is the subgraph of  $G(V, E)$  given by  $H_1 \cap H_2 = (V_1 \cap V_2, E_1 \cap E_2)$ .

# 9 Representation of Graphs

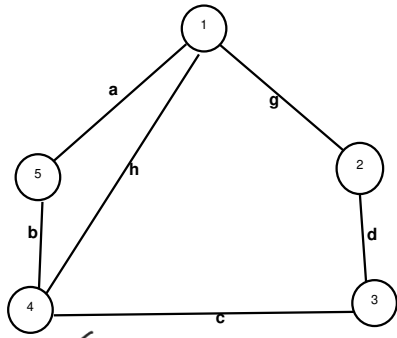

Graphs are usually labelled. Vertices and/or Edges can be labelled.

Labelling of graphs can be done based on

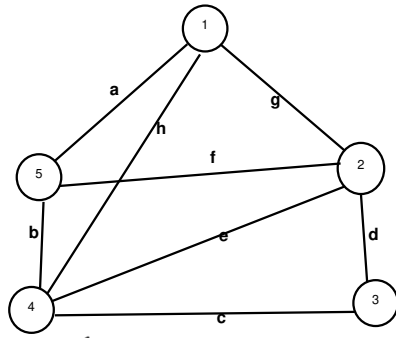

• Vertices

- To give semantic meaning e.g. Places to visit in TSP or Autoroute
- Labels can be arbitrary or change to prove some relationship between graphs
- When we describe edges we usually refer to sets of vertices

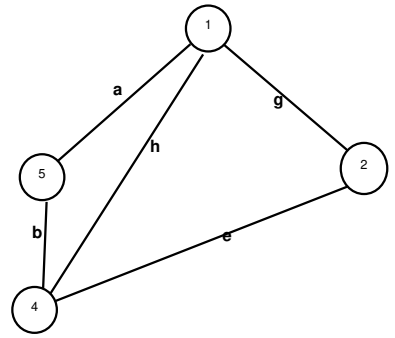

• Edges

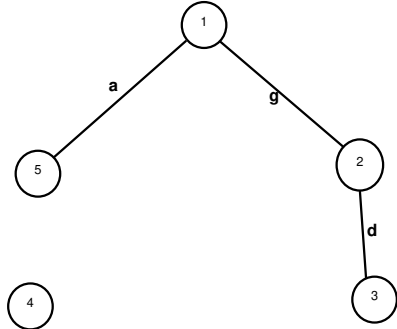

~~(a) Edge Deletion :  $G - e$~~

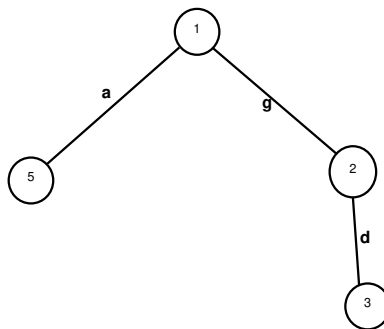

~~(b) Edge Addition :  $G + f$~~

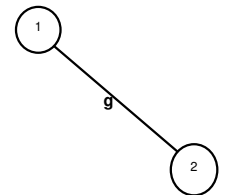

~~(c) Vertex Deletion :  $G - 3$~~

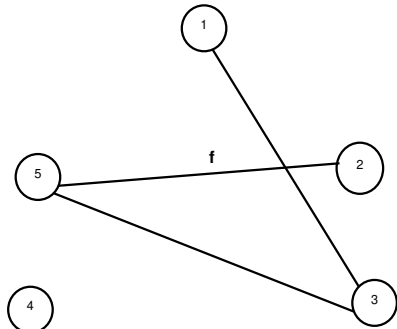

~~(d) Multiple Edge Deletions :  $G - \{43, 42, 41, 45\}$~~

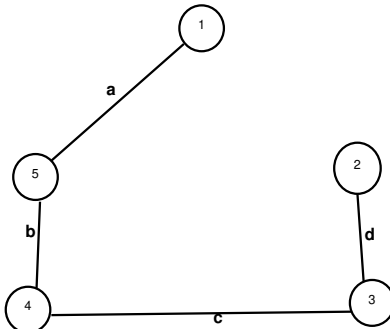

~~(e) Vertex Deletion :  $G - 4 = G \setminus \{43, 42, 41, 45\}$~~

~~(f) Multiple Vertex Deletions :  $G - \{3, 4, 5\}$~~

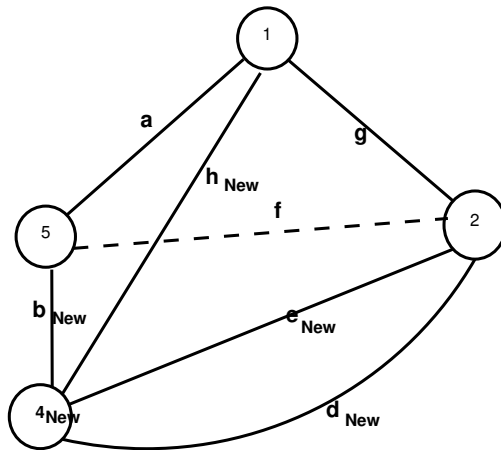

~~(g) Complement of Graph :  $G - E + \overline{E} = \overline{G}$~~

~~(h) Complement of Graph :  $G - E(H) = \overline{H(G)}$~~

~~(i) Graph Deletion :  $G - V(H) = G - H$~~

~~(j) Edge Contract :  $G/c$~~

Figure 12: Operations on Graphs

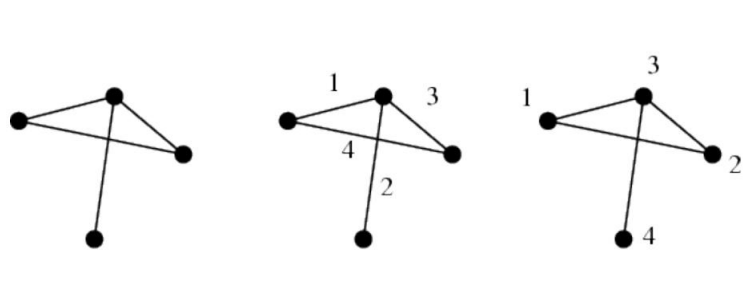

Figure 13: Labeled and Unlabeled Graph

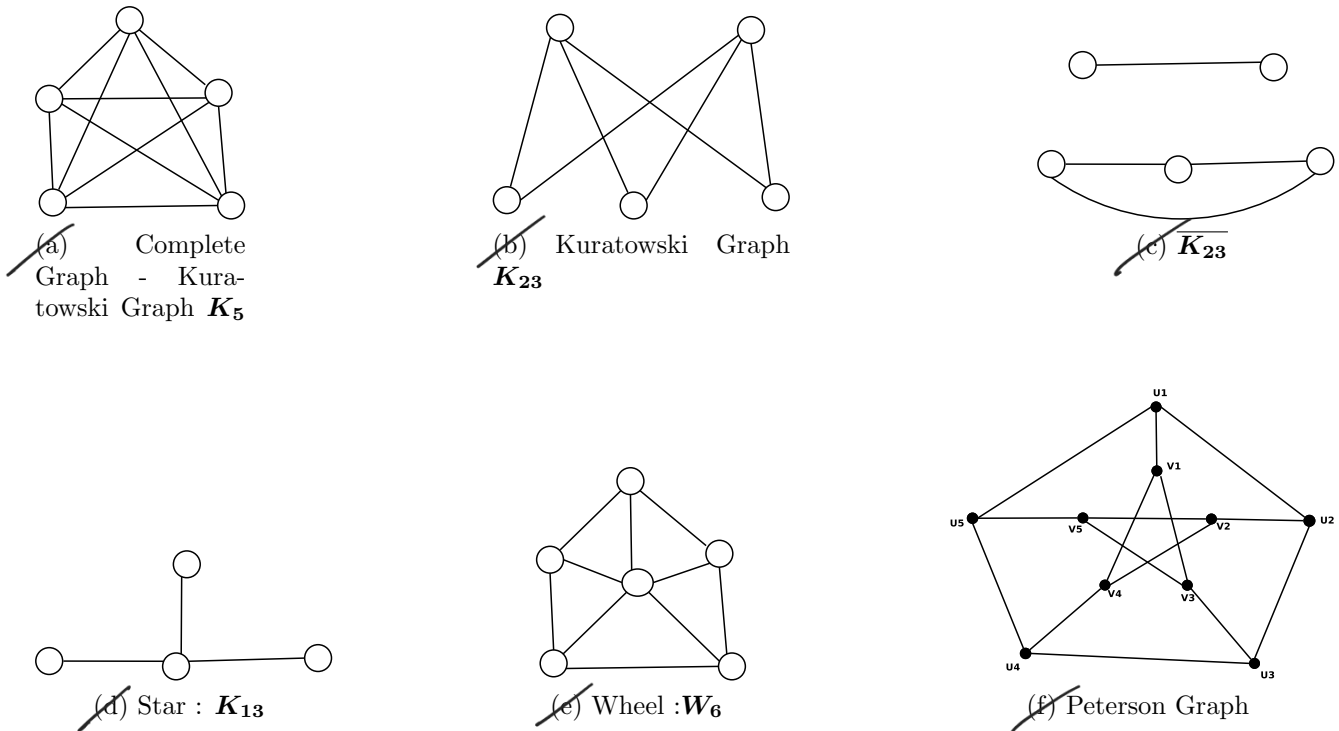

Figure 14: Special Graphs

- We use graphs to represent data, encode knowledge or enforce relationships between data
- Numbers usually represent weights, distances or cost of some relationship between the 2 vertices
- Graph Theory enumerates these weights in many ways to attempt to solve a problem:
  - \* Minimum cost - shortest path
  - \* Maximum cost
  - \* Max-Min costs in game playing
